

All data taken at the Pacific Northwest National Laboratory  
FTS Operators: Tyler O. Danby and John S. Loring  
Data Analysis: Russell G. Tonkyn and Jerome C. Birnbaum

**Composite spectrum for:** Diethylene glycol butyl ether

- First Column: Position in wavenumber ( $\text{cm}^{-1}$ )
- Second column: Real refractive index  $n(\tilde{\nu})$  (dispersion index)
- Third column: Imaginary refractive index,  $k(\tilde{\nu})$  (absorption index per unit length in centimeters)

Where the complex refractive index  $\hat{n} = n(\tilde{\nu}) + ik(\tilde{\nu})$

Following Bertie (in the references below) we define the absorbance as  $A = -\log_{10}(I/I_0)$  and the linear absorption coefficient  $K = A/d$ , where  $d$  is the path length. The connection between the imaginary refractive index and the absorbance coefficient arises from the following:  $2.303K = 4\pi\tilde{\nu}k$

**Sample:**

- Chemical name, formula and CAS number: Diethylene glycol butyl ether,  $\text{C}_8\text{H}_{18}\text{O}_3$ , [112-34-5]
- IUPAC name: 2-(2-Butoxyethoxy)ethanol
- Synonyms: Diethylene glycol monobutyl ether; Butyl CARBITOL™; Butyldiglycol
- Physical properties: FW = 162.23 g/mole; mp =  $-68^\circ\text{C}$ ; bp =  $231^\circ\text{C}$ ;  $\rho = 0.967\text{ g/cm}^3$
- Supplier and stated purity: Aldrich,  $\geq 99\%$  (Lot # MKBW4464V)
- Temperature of sample:  $26^\circ\text{C}$  ( $\pm 1^\circ\text{C}$ )
- Individual samples were measured at the following path lengths: 3.7, 8.4, 16.3, 31.9, 108, 204, 509 and 1035 micrometers ( $\mu\text{m}$ ). Final data are a composite of these spectra.
- Sample cell window material is potassium bromide (KBr).
- Preparation: None.

**Instrument Parameters:**

- Bruker Tensor 37 FTIR, purged with UHP nitrogen
- Spectral range: 7800 to  $400\text{ cm}^{-1}$  (1.282 to 25 microns)
- Instrument resolution:  $2.0\text{ cm}^{-1}$
- Number of interferograms averaged per single channel spectrum: 128
- Apodization: Norton-Bier, Medium
- Phase correction: Mertz
- Scanner velocity: 10 kHz
- Folding limits: 15802 to  $0\text{ cm}^{-1}$
- Interferogram zerofill: 4x
- Spectral interval after zerofilling:  $0.4823\text{ cm}^{-1}$
- IR source: Silicon carbide glow bar
- Beamsplitter: Broadband potassium bromide (KBr)
- Detector: DLTGS at room temperature
- Aperture: 4 mm

### Measured Refractive Index:

The refractive index for Diethylene glycol butyl ether was measured at 27 °C using an Atago model DR-M2/1550 Abbe refractometer. Notch filters were employed in front of a white light source to make measurements at multiple wavelengths. An InGaAs camera was used to detect signal at 1550 nm. The temperature was controlled to match that in the sample compartment of the FTIR using a heated circulating bath.

480 nm: $n = 1.4351$	486 nm: $n = 1.4348$	546 nm: $n = 1.4311$
589 nm: $n = 1.4291$	644 nm: $n = 1.4275$	656 nm: $n = 1.4269$
1550 nm: $n = 1.4185$		

The refractive index,  $n$ , vs. wavelength in microns,  $\lambda$ , was fit to an equation similar to that of Sellmeier:

$$n(\lambda) = \{a + b/(\lambda^2 - c)\}^{1/2}$$

The resulting best-fit equation was used to find the refractive index at the highest energy data point in our experimental spectra. For Diethylene glycol butyl ether, the result was

$$n(7800 \text{ cm}^{-1}) = 1.4194 \text{ at } 27 \text{ }^\circ\text{C}.$$

### Post Processing and Related Parameters:

A composite spectrum was created from 8 absorbance spectra (base-10) taken at 8 path lengths: 3.7, 8.4, 16.3, 31.9, 108, 204, 509 and 1035 micrometers ( $\mu\text{m}$ ). At each path length several spectra were measured and the results averaged for better signal to noise. The measured cell lengths were adjusted using Beer's law plots.

- 1) The imaginary part of the refractive index, or  $k$  vector, was determined for each absorbance file as per Bertie's program "RNJ46A" (see reference above). This takes into account the reflective losses due to the KBr windows.
- 2) A composite  $k$  vector is created via a classical, weighted, linear, least squares fit using the output files of program "RNJ46A": Intercept=0, slope is fitted, individual absorbance values weighted by  $T^2$  (transmission squared), all absorbance values  $\geq 2.5$  are given zero weight. Three composite vectors were created and merged by hand.
  - a) The first  $k$  vector used the results from the 1035 and 509  $\mu\text{m}$  cells. This  $k$  vector determined the final values for the range from 7800 to 3690  $\text{cm}^{-1}$  and 2269 to 1580  $\text{cm}^{-1}$ .
  - b) The second  $k$  vector used the results from the 204 and 108  $\mu\text{m}$  cells. This  $k$  vector determined the final values for the range from 3690 to 3615  $\text{cm}^{-1}$ , 1580 to 1488  $\text{cm}^{-1}$  and 487 to 400  $\text{cm}^{-1}$ .
  - c) The third  $k$  vector used the results from the 16.3 and 8.4  $\mu\text{m}$  cells. This  $k$  vector determined the final values for the range from 3615 to 2269  $\text{cm}^{-1}$  and 1488 to 487  $\text{cm}^{-1}$ .
  - d) The results from the 3.7 and 31.9  $\mu\text{m}$  cells were not used.

- 3) The resulting composite  $k$  vector and the refractive index at  $7800\text{ cm}^{-1}$  were used to create the real or  $n$  vector using the Kramers-Kronig relation, as per Bertie's program "LZZKTB."
- Calculated and estimated errors: Type A = 0.7%.
  - Frequency correction (already applied):  $\tilde{\nu}(\text{corrected}) = [\tilde{\nu}(\text{instrument}) * .99977 + .13186]$  as determined by comparing measured atmospheric spectral lines ( $\text{H}_2\text{O}$  and  $\text{CO}_2$ ) to values from the Northwest Infrared Spectral Library Database.
  - Axis units:  $X = \text{wavenumbers (cm}^{-1}\text{)}$ ;  $Y = \text{Absorbance (base 10)}$ .
