OPTICAL MICROSCOPY —

A Keyence VHX-1000 digital microscope with 16-bit resolution is used to provide photomicrographs of the various samples and particle sizes. Software included with the microscope differentiates the brightness and colors in the image and extracts the bright objects to produce a binary image. The software assumes all adjacent bright points are part of the same object then calculates the area for each of these objects. The area (A) is used to calculate the mean particle diameter (d) by assuming the particles are spherical and using the relationship 

\[ d = \left( \frac{4 \times A}{\pi} \right)^{1/2} \]

Although the assumption of spherical particles is clearly not always valid, this procedure provides a reasonable estimate of the mean particle size.
